## **OVERVIEW OF THE OIL SPILL RESPONSE: FAST WATER DECISION TOOL**

### **Purpose**

This document provides oil spill response personnel with a job aid for organizing and implementing oil spill containment and cleanup measures in a fast water environment. Fast water refers to any situation where river, harbor or estuary surface current velocities are expected to exceed one knot. Experience and research have shown that special strategies and tactics are warranted in channeling, containing and recovering spilled oil, and safety should be a main concern.

This decision tool is a companion document to the more comprehensive report, "Oil Spill Response in Fast Currents, a Field Guide," published by the Coast Guard R&D Center in 2002, which is available from the National Technical Information Service in Springfield, VA. This decision tool assumes that the user will have read and understood the material contained in the parent Field Guide. This tool has been limited to essential graphics and tables to refresh the responder's memory, allow him/her to quickly assess the situation and formulate an action plan, and communicate this plan to other personnel.

### **Organization**

The decision tool is organized to provide information for developing fast water response strategies. This process is depicted in the decision flow diagram in Figure 1. For each step in the process, the necessary input information and options are specified. Tables and figures provide the primary options open to the responder, and graphically depict various boom and skimmer tactics for oil exclusion, diversion and recovery. In addition, a set of easy to use graphics and tables is provided to allow the responder to compute key deployment parameters such as boom length, deflection angles, mooring line tension and the number of anchors required.

### **Relation to Other Spill Response Documents and Resources**

In addition to familiarity with the Field Guide, responders should be familiar with the basic National Interagency Incident Management System/Incident Command System (NIIMS/ICS) spill response doctrine as outlined in the USCG Incident Management Handbook. The Area Contingency Plan should also be available and consulted for information on sensitive resource locations and environmental data such as anticipated current velocities, oil behavior and natural collection points. The responder should also consult with the NOAA Scientific Support Coordinator (SSC), local First Responders, as well as harbormasters and local mariners to gather information to verify the viability of the strategy and tactics arrived at using this decision tool.

	Isolated Areas	<ul style="list-style-type: none"> <li>▪ Sorbents and Pom-Poms</li> </ul>

## SAFETY

Oil spill response is an inherently hazardous operation. It involves handling a hazardous material in a marine environment often under less than ideal sea and weather conditions. Deploying, operating and retrieving heavy and cumbersome oil spill response equipment routinely requires physical exertion and subjects responders to heat and cold stress. Responding to spills in fast water environments imposes additional hazards due to the extreme loads placed on equipment and the danger of personnel being swept away in the fast currents. Coast Guard personnel must perform Operational Risk Management (ORM) as outlined in COMDTINST M35003 before initiating response actions. (see process below).

### Operational Risk Management Process

1. Identify Mission Tasks
2. Identify Hazards
3. Assess Risks
4. Identify Options Tables
5. Evaluate Risk vs. Gain
6. Execute Decision
7. Monitor Situation

Table 3 summarizes the major hazards, potential injuries and risk control measures associated with fast-water oil spill response. The water hazards are defined in some detail as these are the single most dangerous hazards associated with fast water response.

If an individual should accidentally fall in the water, there are a number of things that both the victim and rescuers should remember:

- Don't swim against the current. Swim perpendicular.
- Swim on back, feet downstream.
- Use hands and feet to fend off obstructions.
- Do not tie rope around swimmer or rescuer.
- Angle rescue lines down current.
- Stay on upstream side of the line.
- Never clip into the line.

Table 3. Fast-water oil spill response hazard summary.

Hazard	Injury Potential	Control
Slips, Trips and Falls	Broken limbs, lacerations, head injuries	Awareness, protective clothing, safety lines
Ergonomic	Back injury, joint injuries, hernias	Proper lifting methods, lifting devices
Heat and Cold Stress	Frost bite, hypothermia, heat stroke	Proper clothing, nutrition, rest, & medical monitoring
Flammability – Fire & Explosion	Death, severe burns, broken limbs, loss of eyes	Awareness, proper ventilation, monitoring
Oil Toxicity	Eye/skin irritation, nausea, dizziness, long term effects	Air monitoring, respiratory protection, gloves, coveralls
Line Hazards	Death, loss of limbs & eyes, broken limbs	Adequate line strength, safety observer, knife available
Heavy Equipment Hazards	Damage to eyes, hearing loss, exhaust inhalation, cuts and abrasions	Eye and ear protection, secure loose clothing, stay clear of danger points/ exhaust
Water (drowning)	<p><b>Critical - death, hypothermia</b></p> <p><b>Consider the following:</b></p> <ul style="list-style-type: none"> <li>• Don't swim against current, swim perpendicular</li> <li>• Swim on back, feet downstream</li> <li>• Use hands and feet to fend off obstructions</li> <li>• Do not tie rope around swimmer or rescuer</li> <li>• Angle rescue lines down current</li> <li>• Stay on upstream side of the line</li> <li>• Never clip into the line</li> </ul>	<ul style="list-style-type: none"> <li>• Buddy System</li> <li>• Life jackets</li> <li>• Cold weather gear</li> <li>• Fall restraints</li> <li>• Life rings, boat hooks</li> <li>• Rescue boats</li> <li>• Avoid waders</li> <li>• Bicycle helmets can be substituted for hardhats only if no overhead hazards exits</li> <li>• Avoid slip on fireman boots</li> <li>• Avoid loose clothing</li> </ul>

## **HYDRODYNAMIC CONSIDERATIONS AND BOOMING RESOURCES**

In assessing the overall feasibility of implementing a fast water booming tactic, it is necessary to determine key hydrodynamic parameters and assess the adequacy of on-scene resources based on these parameters. The definition's process for accomplishing this is depicted in Figure 14, which outlines a procedure for determining the necessary parameters.

**Definitions:**

- Current Speed (V in knots) and Water Depth (D in feet)
- Profile Length-width that needs to be boomed: This is the value X in the bottom of figure 15.
- Maximum Deployment Angle of the boom (from Figure 15 or Table 4),
- Minimum Length of Boom required (Lboom from Table 4),
- Total Force exerted on the boom (Tboom from Table 4), and
- Number of Anchor Points (AP#) required assuming a minimum of 50 feet of spacing (AP# from Table 4).

**Mooring Line:**

A conservative estimate of the total length of mooring line (Lline) required per anchor point is  $D \times 7$ . The tension on each mooring line is estimated by  $T_{line} = T_{boom} / AP\#$ .

The tension on each mooring line should then be checked against the lines Nominal Breaking Strength (from Table 5) and the Holding Power of each anchor (from Table 6). The value of the  $T_{line}$  should be less than both these values.

**Boat Horsepower:**

The horsepower required (HPmin) for a deployment vessel to maintain the boom at this deployment angle in the current can be estimated as follows:

- For an outboard motor:  $HP_{min} = T_{boom}/15$
- For an inboard motor:  $HP_{min} = T_{boom}/20$
- For a jet drive motor:  $HP_{min} = T_{boom}/10$

**Anchoring:**

Examples of anchoring techniques are shown in Figures 16-18.

Figure 14. Hydrodynamic considerations and booming requirements.

**Figure 15. Maximum boom deployment angles required to prevent oil entrainment.**

**Table 4. Boom Hydrodynamics Table for 100 foot profile. (For larger values of  $X$ , values of  $L_{boom}$ ,  $T_{boom}$  and AP# can be easily calculated by multiplying by the multiple of 100 feet ( $X$  feet/100 feet)).**

Time to Drift 100 Feet (Seconds)	Velocity (Knots)	Max Boom Deflection Angle (Degrees)	Boom Length Required for 100 ft. Profile to Current (feet)	T=Total Force on Boom (pounds) (without Waves) K=2 per 100 ft. of boom length			Total Force on Boom (pounds) (with Waves) K=4 per 100 ft. of boom length			Anchors if Placed every 50 ft. or less
				6 inch boom draft	12 inch boom draft	18 inch boom draft	6 inch boom draft	12 inch boom draft	18 inch boom draft	
100	0.5	90	100	25	50	75	50	100	150	3
60	1.0	45	150	71	141	212	142	282	424	4
40	1.5	30	225	112	225	338	224	450	676	6
30	2.0	20	300	137	274	410	274	548	820	7
20	3.0	13	450	202	405	607	404	810	1214	10
15	4.0	10	625	284	567	851	568	1134	1702	14
12	5.0	8	725	348	696	1004	696	1392	2008	16
10	6.0	7	875	438	877	1316	876	1574	2632	18

#### Equations for Boom Force (T<sub>boom</sub>) in Table 4

For a quick approximate load on a boom that is anchored at an angle of between 10 and 30 degrees to the current, use the following formula:

$T = K * A * V^2$  where:   
 T = tensile force, lb,  
 K = constant, lb<sub>t</sub> / (ft<sup>2</sup> x knots<sup>2</sup>)  
 A = projected area of the submerged portion of the boom, ft<sup>2</sup>  
 V = tow speed, knots

The projected area of the boom was calculated based on the boom draft, and the length of the boom normal to the water current (i.e., the direction of travel):

$A = d * L * \sin \theta$  where: A = projected area of the submerged portion of the boom, ft<sup>2</sup>  
 d = boom draft, feet  
 L = boom length, feet (100 ft)  
  $\theta$  = diversion angle (10°, 20°, 30°)

Table 5. Nominal line breaking strengths (pounds).

Diameter (inches)	Manila	Polypropylene (Three-Strand)	Nylon (Triple Strand)	Nylon (Double Braid)	Polyester (Double Braid)
5/16	900	1700	2300	3400	2400

<b>DENSITY ESTIMATIONS</b>		
	<b>Barrels/Long Ton</b>	<b>Notes:</b>
	<b>Range</b>	<b>Average</b>
<b>Crude Oils</b>	<b>6.7 - 8.1</b>	<b>7.4</b>
<b>Aviation Gasolines</b>	<b>8.3 - 9.2</b>	<b>8.8</b>
<b>Motor Gasolines</b>	<b>8.2 - 9.1</b>	<b>8.7</b>
<b>Kerosenes</b>	<b>7.7 - 8.3</b>	<b>8.0</b>
<b>Gas Oils</b>	<b>7.2 - 7.9</b>	<b>7.6</b>
<b>Diesel Oils</b>	<b>7.0 - 7.9</b>	<b>7.5</b>
<b>Lubricating Oils</b>	<b>6.8 - 7.6</b>	<b>7.2</b>
<b>Fuel Oils</b>	<b>6.6 - 7.0</b>	<b>6.8</b>
<b>Asphaltic Bitumens</b>	<b>5.9 - 6.5</b>	<b>6.2</b>
Specific Gravity of 1 or an API of 10 equals the density of fresh water.		
<ul style="list-style-type: none"> <li>• 1 Long Ton equals 2,200 lbs.</li> <li>• As a general approximation, use 7 bbl. (300 U.S. gallons) per metric ton of oil.</li> <li>• 6.4 barrels/long ton is neutrally buoyant in fresh water. Open ocean neutral buoyancy values are generally in the 6.21-6.25 barrels/long ton range.</li> </ul>		

Specific Gravity < 1 or an API > 10 indicates product is lighter than fresh water. API Gravity = (141.5/Specific Gravity) - 131.5			
Weight of Fresh Water: pounds/gallon	8.3	Note: Exact weight depends on temperature and	
Weight of Sea Water: pounds/gallon	8.5		salinity.

OIL THICKNESS ESTIMATIONS			
Standard Term	Approx. Film Thickness Inches	Approx. Film Thickness Mm	Approx. Quantity of Oil in Film
Barely Visible	0.0000015	0.00004	25 gals/mile <sup>2</sup> 44 liters/km <sup>2</sup>
Silvery	0.000003	0.00008	50 gals/mile <sup>2</sup> 88 liters/km <sup>2</sup>
Slight Color	0.000006	0.00015	100 gals/mile <sup>2</sup> 176 liters/km <sup>2</sup>
Bright Color	0.000012	0.0003	200 gals/mile <sup>2</sup> 351 liters/km <sup>2</sup>
Dull	0.00004	0.001	666 gals/mile <sup>2</sup> 1,168 liters/km <sup>2</sup>
Dark	0.00008	0.002	1,332 gals/mile <sup>2</sup> 2,237 liters/km <sup>2</sup>

Thickness of light oils: 0.0010 inches to 0.00010 inches.  
Thickness of heavy oils: 0.10 inches to 0.010 inches.

COMMONLY-USED EQUATIONS			
Circle: Area = $3.14 \times \text{radius}^2$ Circumference = $3.14 \times \text{diameter}$		Cylinder/Pipe/Tank Volume = $3.14 \times \text{radius}^2 \times \text{length}$	
Sphere/Tank Area = $4 \times 3.14 \times \text{radius}^2$ Volume = $1.33 \times 3.14 \times \text{radius}^3$		Rectangle/Square Area = length x width	
		Cube/Block/Tank Volume = length x width x height
